HOTEL MANAGEMENT SYSTEM

Computer Science (083) Project

Developed By
MAYANK SAHAI

Index

Certificate

This is to certify that BANK MANAGEMNT SYSTEM Computer Science project is developed by **MAYANK SAHAI** under my supervision in the session 2023-2024.

The work done by them is original.

_____ Computer Science Teacher

Date: _____

Acknowledgement

We express our immense gratitude to our Computer Science teacher Mrs. POOJA KHARE for her intellectual vigour and generously given support that has been invaluable in escalating our determination to reach the goal of writing this project successfully.

We can hardly find appropriate words to express our obligations and gratefulness to the Principal and the Director for including such projects in our curriculum.

We also feel immense pleasure in recording deep sense of indebtedness, gratitude and sincere thanks to all fellow group mates for their help,company and hardwork.

We are especially indebted to our parents for their sincere love, moral support and spontaneous encouragement throughout the entire period of this work.

Thank you!

Project Synopsis

Introduction

- This project is all about software for the Hotel management system.
- The Hotel Management System is a software application designed to streamline hotel operations. It provides functionalities such as room management, customer management, and booking management. The system enhances efficiency, reduces errors, and improves user experience.

AIM

- The objective of this project is to let us apply programming knowledge into a real- world situation/problem and expose how programming skills help in developing a good software.

Idea Source

- **Challenges with Manual Systems**: Traditional hotel management systems are often inefficient, leading to errors in booking, room allocation, and customer data management.
- **Technological Advancements**: The rise of digital technologies has created an opportunity to improve the efficiency and accuracy of hotel operations through automation.
- **Need for Real-Time Data**: Hotels require systems that can track room availability, bookings, and customer data in real-time, ensuring smoother operations and better decision-making.
- **Growing Customer Expectations**: Customers expect a seamless, fast, and personalized experience during booking, check-in, and check-out, which can be better managed with digital systems.
- **Industry Trends**: As the hospitality industry grows, there's an increasing demand for scalable solutions that can manage multiple locations and provide insightful business analytics.

Plan For Implementation

The system uses a **MySQL database** to manage data. Key features include:

- **Room Management**: Add, update, and delete room records.
- **Customer Management**: Register and view customer details.
- **Booking Management**: Issue and view booking records.

```

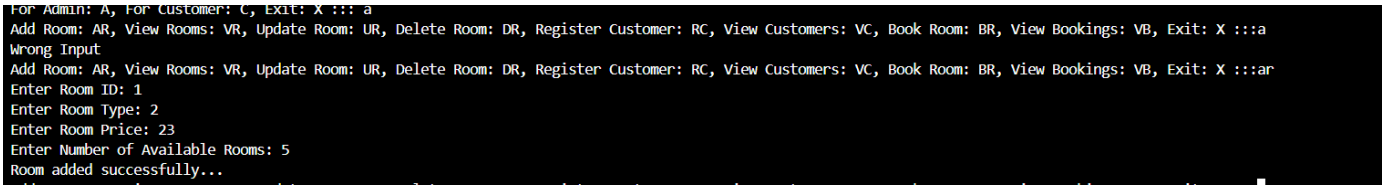
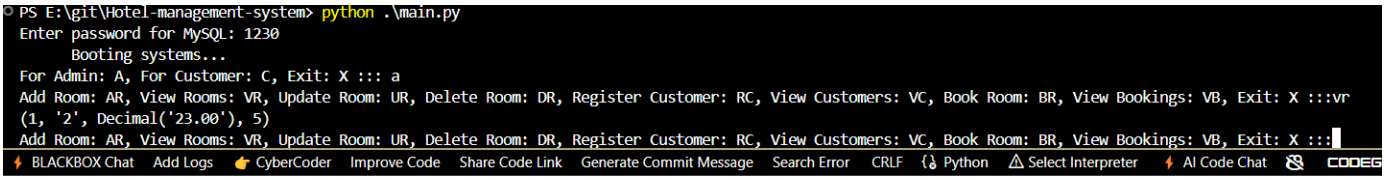
OUTPUT

➢ Admin Controls

- **Add room**



- View room



➢ User Controls

- View Room

```
PS E:\git\Hotel-management-system> python .\main.py
Enter password for MySQL: 1230
      Booting systems...
For Admin: A, For Customer: C, Exit: X ::: c
Customer Interface
View Available Rooms: VR, Book Room: BR, View Your Bookings: VB, Exit: X :::vr
(1, '2', Decimal('23.00'), 5)
View Available Rooms: VR, Book Room: BR, View Your Bookings: VB, Exit: X :::x
```

Hardware Requirement

PC/Laptop/MacBook with Intel core/i3/i5/i7 or any equivalent With at least 2 GB RAM 10 MB free space on Hard

Disk LCD/LED

Operating System & Compiler

MS Windows/Ubuntu/MacOS

Python IDLE 3.x

OR

colab.research.google.com (gmail account)

and/or

MySQL 8.x
